Mounting Heater to Zoo Med Reptihabitat Terrariums:

Certain models of Zoo Med's ReptiHabitat terrariums have built-in raised feet allowing for bottom ventilation. Contact Zoo Med if you are unsure if you have this style terrarium.

- Clean and dry the bottom, outside glass of the terrarium.
- Heater should be placed to one side of the terrarium if possible.
- There are two notches in the backside of the base on the terrariums. Run the power cord out through one of these notches as shown.
- Remove white adhesive paper from the back of the heater, attach to glass and gently rub entire surface of heater to ensure firm contact and secure attachment.

Mounting Heater to Traditional Glass Terrariums:

Traditional glass terrariums have flat bottom frames and the enclosed rubber feet must be used to allow for bottom ventilation.

- Clean and dry the bottom, outside glass of the terrarium.
- Heater should be placed to one side of the terrarium if possible.
- Remove the adhesive backing and stick the rubber feet to each of the four bottom corners of the terrarium as shown. This allows for slight elevation of the terrarium **thus allowing excess heat to escape** (very important).
- Remove white adhesive paper from the back of the heater, attach to glass and gently rub entire surface of heater to ensure firm contact and secure attachment.

Side-mounting Heater to Glass Terrariums:

- When space allows, side-mounting of this heater is possible.
- Locate a suitable area on the **OUTSIDE** glass of the terrarium. **DO NOT** mount the heater inside the terrarium.
- Clean and dry the area where the heater will be mounted.
- Remove the white adhesive backing from the heater and stick the heater to the glass. Gently rub the entire surface of heater to ensure firm contact and secure attachment.

Notes on Substrates:

When used on the outside bottom of the terrarium, a suitable substrate must be used to protect snakes from coming in direct contact with the heated glass. Recommended substrates include Zoo Med's Aspen Snake Bedding, Zoo Med's Eco Carpet, or Zoo Med's Repti Chips. **Using newspaper, paper towels, cloth towels, or any similarly light product in place of a substrate is not appropriate with this heater, and such use will void any and all guarantees and release Zoo Med from any liability for damage to product, property, or animals.** When using sand substrates, **it is important to use no more than 1.5" (3.8 cm) depth of sand type substrates.**
